Implement bubble_tint(bubble) in game.py. Return an RGB tuple that changes smoothly as a bubble approaches expiration, using bubble.life and BUBBLE_LIFE. Make trapped-enemy bubbles visually distinct from empty bubbles. Return None only when appropriate. Keep all RGB values between 0 and 255, handle edge cases, and do not change unrelated gameplay code. Explain and show the diff.

Implement on_fruit_collected(fruit) in game.py. Add a running fruit-collection counter and display it in the HUD. Preserve the existing fruit score logic and avoid counting a fruit more than once. Initialize the counter correctly when a new game is reset. Make the smallest clear changes necessary, explain every modified section, and show the diff.

Implement bonus_life_threshold() in game.py. Return 5000 so the player receives an extra life each time their score crosses a new 5000-point milestone. Preserve the existing bonus_awarded bookkeeping, ensure a milestone cannot award multiple lives repeatedly across frames, and do not modify unrelated logic. Explain how the existing implementation works and show the diff.
